Telephone (708) 229-3361

CONSUMER CONFIDENCE REPORT (CCR) FOR 2019

This year, as in years past, your tap water met all USEPA and state drinking water health standards. Our system vigilantly safeguards its water supply, and we are able to report that the department had no violation of a contaminant level or of any other water quality standard in the previous year. This report summarizes the quality of water that we provided last year, including details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. We are committed to providing you with information because informed customers are our best allies.

If you have any questions about this report or concerning your water system, please contact Mike Ward at (708) 229-3361. We want our valued customers to be informed about their water quality. If you would like, please feel welcome to attend any of our regularly scheduled village board meetings on the first and third Monday of every month. The meetings are held in the council chambers, on the second floor above the village hall, at 9418 South Kedzie Avenue at 7:30 PM.

Our village uses surface water from Lake Michigan that is purchased from the City of Chicago. Chicago provides all treatment of the water with the exception of additional chlorine being added by the Village for disinfection. We receive our water from Chicago, which is transmitted by water mains to three underground storage tanks with a total capacity of 4 million gallons. In addition, the Village has three emergency connections to the City of Chicago located through out Evergreen Park.

Lake Michigan is the sole source of water used to provide drinking water for Chicago and approximately 125 suburban communities. The Environmental Protection Agency (EPA) has found

that the quality of Lake Michigan has improved dramatically over the past 20 years. Lake Michigan, by volume, is the second largest Great Lake and the only one located totally within the United States. It serves as a source of drinking water, as a place for swimming and fishing, as a scenic wonderland, and as a sink for municipal and industrial waste and runoff from the surrounding lands. All 63 miles of shoreline within Illinois are now considered to be in good condition.

The Illinois EPA implemented a Source Water Assessment Program (SWAP) to assist with watershed protection of public drinking water supplies. If you would like a copy of this information, please contact Mike Ward at (708) 229-3361. The Illinois EPA considers all surface water sources of community water supplies to be susceptible to potential pollution problems. The very nature of surface water allows contaminants to migrate into the intake with no protection, only dilution. This is the reason for mandatory treatment for all surface water supplies in Illinois. Chicago's offshore intakes are located at a distance that shoreline impacts are not usually considered a factor on water quality. At certain times of the year, however, the potential for contamination exists due to wet-weather flows and river reversals. In addition, the placement of the crib structures may serve to attract waterfowl, gulls and terns that frequent the Great Lakes area, thereby concentrating fecal deposits at the intake and thus compromising the source water quality. Conversely, the shore intakes are highly susceptible to storm water runoff, marinas and shoreline point sources due to the influx of groundwater to the lake.

Some people may be more vulnerable to contaminants in drinking water than the general

Continued On Next Page

population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

The Chicago Department of Water Management has continued monitoring for Cryptosporidium, Giardia and E. coli in its source water as part of its water quality program. To date, Cryptosporidium has not been detected in these samples, but Giardia was detected in 2010 in one raw lake water sample collected in September 2010. Treatment processes have been optimized to provide effective barriers for removal of Cryptosporidium oocysts and Giardia cysts in the source water, effectively removing these organisms in the treatment process.

By maintaining low turbidity through the removal of particles from the water, the possibility of Cryptosporidium and Giardia organisms getting into the drinking water system is greatly reduced.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it can dissolve naturally occurring minerals and radioactive materials, and can pick up substances resulting from the presence of animals or from human activity. Possible contaminants consist of:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife;
- Inorganic contaminants, such as salts and metals, which may be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining or farming;
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff and residential uses;
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and may also come from gas stations, urban storm water runoff and septic systems;
- Radioactive contaminants, which may be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, USEPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

In addition to the informational section of the Consumer Confidence Report, we have included for your review several tables for the Village of Evergreen Park and the City of Chicago. The tables will give you a better picture of the contaminants that were detected in your water and the contaminants that were tested for but not detected.

Village of Evergreen Park

2019 Water Quality Data

-Definition of Terms-

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Highest Level Detected: This column represents the highest single sample reading of a contaminant of all the samples collected.

Range of Detections: This column represents a range of individual sample results; from lowest to highest that were collected during the CCR calendar year.

Date of Sample: If a date appears in this column, the Illinois EPA requires monitoring for this contaminant less than once per year because the concentrations do not frequently change. If no date appears in the column, monitoring for this contaminant was conducted during the Consumer Confidence Report calendar year.

Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

nd: Not detectable at testing limits.

n/a: Not applicable.

Detected Contaminants

Contaminant (unit of measurement) Typical Source of Contaminant	MCLG	MCL	Highest Level Detected	Range of Detections	Violation	Date of Sample
<u>Inorganic Contaminants</u>						
LEAD (ppb) Corrosion of household plumbing systems; Erosion of natural deposits.	0	AL=15	4.36 (90th Percentile)	nd – 9.31		July 2017
<u>Disinfectants\Disinfection By-Products</u>						
TTHMs [TOTAL TRIHALOMETHANES] (ppb) By-product of drinking water chlorination.	n/a	80	35.00	19.32 – 40.50		
HAA5 [HALOACETIC ACIDS] (ppb) By-product of drinking water chlorination	n/a	60	22.00	12.70 – 33.70		
CHLORINE (as Cl ₂) (ppm) Water additive used to control microbes.	4.0	4.0	0.80	0.80 – 0.80		
<u>Unit of Measurement - Definitions</u> ppb - Parts per billion, or micrograms per liter ppm - Parts per million, or milligrams per liter	* OEL – Operational Evaluation Levels					

Water Quality Data Table Footnotes

UNREGULATED CONTAMINANTS:

A maximum contaminant level (MCL) for this contaminant has not been established by either state or federal regulations, nor has mandatory health effects language. The purpose for monitoring this contaminant is to assist USEPA in determining the occurrence of unregulated contaminants in drinking water, and whether future regulation is warranted.

2019 Violation Summary Table for Evergreen Park

Violation Description
No drinking water quality violations were recorded during 2019.

Village of Evergreen Park 2019 Water Quality Data

-Definition of Terms-

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Level Found: This column represents an average of sample result data collected during the CCR calendar year. In some cases, it may represent a single sample if only one sample was collected.

Date of Sample: If a date appears in this column, the Illinois EPA requires monitoring for this contaminant less than once per year because the concentrations do not frequently change. If no date appears in the column, monitoring for this contaminant was conducted during the CCR calendar year.

nd: Not detectable at testing limits.

n/a: Not applicable.

Contaminant (unit of measurement) Typical Source of Contaminant	MCLG	MCL	Level found	Date of Sample
Microbial Contaminants				
TOTAL COLIFORM BACTERIA (# pos/mo) Naturally present in the environment.	0	>1	1	08/27/2019
FECAL COLIFORM AND E. COLI (# pos/mo) Human and animal fecal waste.	0	0	0	

Unit of Measurement - Definitions

- ppm - Parts per million, or milligrams per liter
- ppb - Parts per billion, or micrograms per liter
- # pos/mo - Number of positive samples per month

Village of Evergreen Park

2019 Non-regulated Contaminant Detections

UCMR4 Compliance Reporting

In compliance with the Unregulated Contaminant Monitoring Rule 4 (UCMR4) as required by the EPA, the Village of Evergreen Park has monitored for 30 contaminants suspected to be present in drinking water, but that do not have health-based standards set under the Safe Drinking Water Act. The monitoring results were reported to the EPA. The list of UCMR4 contaminants that we have monitored include two metals, eight pesticides plus one pesticide manufacturing byproduct, three alcohols, and three semi volatile organic chemicals (SVOCs). UCMR4 also requires Assessment Monitoring for three brominated haloacetic acid (HAA) disinfection byproducts groups. The contaminants that were detected in this monitoring program are listed below.

-Definition of Terms-

Highest Level Detected: This column represents the highest single sample reading of a contaminant of all the samples collected.

Range of Detections: This column represents a range of individual sample results, from lowest to highest that were collected during the CCR calendar year.

Date of Sample: If a date appears in this column, the Illinois EPA requires monitoring for this contaminant less than once per year because the concentrations do not frequently change. If no date appears in the column, monitoring for this contaminant was conducted during the CCR calendar year.

nd: Not detectable at testing limits.

<i>Contaminant (unit of measurement) Typical Source of Contaminant</i>	<i>Highest Level Detected</i>	<i>Range of Detections</i>	<i>Date of Sample</i>
MANGANESE (ppb) Naturally-occurring element; commercially available in combination with other elements and minerals; used in steel production, fertilizer, batteries and wastewater treatment chemical; essential nutrient.	1.3	0.46 – 1.3	
TOTAL HALOACETIC ACIDS (HAA5) (ppb) By-product of drinking water chlorination.	18.0	8.6 – 18.0	
TOTAL HALOACETIC ACIDS - (HAA6Br) (ppb) By-product of drinking water chlorination.	12.0	7.8 – 12.0	
TOTAL HALOACETIC ACIDS (HAA9) (ppb) By-product of drinking water chlorination	28.0	16.0 – 28.0	

Unit of Measurement - Definition

ppb - Parts per billion, or micrograms per liter

nd: Not detectable at testing limits. **n/a:** Not applicable

Detected Contaminants

Contaminant (unit of measurement) Typical Source of Contaminant	MCLG	MCL	Highest Level Detected	Range of Detections	Violation	Date of Sample
<u>Turbidity Data</u>						
TURBIDITY (NTU/ Lowest Monthly %≤0.3 NTU) Soil runoff. Lowest monthly percent meeting limit.	n/a	TT (Limit 95%≤0.3 NTU)	100% (Lowest Monthly %)	100% – 100.0%		
TURBIDITY (NTU/Highest Single Measurement) Soil runoff.	n/a	TT (Limit 1 NTU)	0.14	n/a		
<u>Inorganic Contaminants</u>						
BARIUM (ppm) Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits.	2	2	0.0208	0.0195 – 0.0208		
NITRATE (AS NITROGEN) (ppm) Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.	10	10	0.35	0.33 – 0.35		
TOTAL NITRATE & NITRITE (AS NITROGEN) (ppm) Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.	10	10	0.35	0.33 – 0.35		
<u>Total Organic Carbon</u>						
TOC [TOTAL ORGANIC CARBON] The percentage of Total Organic Carbon (TOC) removal was measured each month and the system met all TOC removal requirements set by IEPA.						
<u>Unregulated Contaminants</u>						
SULFATE (ppm) Erosion of naturally occurring deposits.	n/a	n/a	26.7	25.8 – 26.7		
SODIUM (ppm) Erosion of naturally occurring deposits; Used as water Softener	n/a	n/a	10.2	8.73 – 10.2		
<u>State Regulated Contaminants</u>						
FLUORIDE (ppm) Water additive which promotes strong teeth.	4	4	0.79	0.62 – 0.79		
<u>Radioactive Contaminants</u>						
COMBINED RADIUM (226/228) (pCi/L) Decay of natural and man-made deposits.	0	5	0.84	0.50 – 0.84		2/11/2014
GROSS ALPHA excluding radon and uranium. (pCi/L) Decay of natural and man-made deposits.	0	15	6.6	6.1 – 6.6		2/11/2014

City of Chicago

2019 Water Quality Data (Continued)

Detected Contaminants

Unit of Measurement - Definitions

NTU - Nephelometric Turbidity Unit, used to measure cloudiness in drinking water

%≤0.3 NTU - Percent samples less than or equal to 0.3 NTU

pCi/L - Picocuries per liter, used to measure radioactivity.

ppm - Parts per million, or milligrams per liter

ppb - Parts per billion, or micrograms per liter

Water Quality Data Table Footnotes

TURBIDITY

Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of water quality and the effectiveness of our filtration system and disinfectants.

UNREGULATED CONTAMINANTS:

A maximum contaminant level (MCL) for this contaminant has not been established by either state or federal regulations, nor has mandatory health effects language. The purpose for monitoring this contaminant is to assist USEPA in determining the occurrence of unregulated contaminants in drinking water, and whether future regulation is warranted.

FLUORIDE

Fluoride is added to the water supply to help promote strong teeth. The Illinois Department of Public Health recommends an optimal fluoride range of 0.9 mg/l to 1.2 mg/l until November 2015. As of November 2015, the new recommendation is an optimal fluoride level of 0.7 mg/l.

SODIUM

There is no state or federal MCL for sodium. Monitoring is required to provide information to consumers and health officials who have concerns about sodium intake due to dietary precautions. If you are on a sodium-restricted diet, you should consult a physician about the level of sodium in the water.

Source Water Assessment Summary

Source Water Location

The City of Chicago utilizes Lake Michigan as its source water via two water treatment plants. The Jardine Water Purification Plant serves the northern areas of the City and suburbs, while the Sawyer (formerly South) Water Purification Plant serves the southern areas of the City and suburbs. Lake Michigan is the only Great Lake that is entirely contained within the United States. It borders Illinois, Indiana, Michigan, and Wisconsin, and is the second largest Great Lake by volume with 1,180 cubic miles of water and third largest by area.

Source Water Assessment Summary

The Illinois EPA implemented a Source Water Assessment Program (SWAP) to assist with watershed protection of public drinking water supplies. The SWAP inventories potential sources of contamination and determined the susceptibility of the source water to contamination. The Illinois EPA has completed the Source Water Assessment Program for Chicago's supply. Further information on Chicago's water supply's Source Water Assessment Program is available by calling the City of Chicago, Department of Water Management at 312-744-6635.

2019 VOLUNTARY MONITORING

The City of Chicago has continued monitoring for Cryptosporidium, Giardia and E. coli in its source water as part of its water quality program. To date, Cryptosporidium has not been detected in these samples, but Giardia was detected in 2010 in one raw lake water sample collected in September 2010. Treatment processes have been optimized to provide effective barriers for removal of Cryptosporidium oocysts and Giardia cysts in the source water, effectively removing these organisms in the treatment process. By maintaining low turbidity through the removal of particles from the water, the possibility of Cryptosporidium and Giardia organisms getting into the drinking water system is greatly reduced.

In 2019, CDWM has also continued monitoring for hexavalent chromium, also known as chromium-6. USEPA has not yet established a standard for chromium-6, a contaminant of concern which has both natural and industrial sources. Please address any questions or concerns to Chicago's Water Quality Division at 312-742-7499. Data reports on the monitoring program for chromium-6 are posted on the City's website which can be accessed at the following address below:

Village of Evergreen Park

A Note from Mayor Sexton,

Hello all, and I hope that you are keeping safe and healthy during this COVID-19 pandemic. Obviously, in the best interests of our community, we had to shut down the activities of our Recreation Department, Youth Department, and the Office of Citizen Services. We are hopeful that some of these activities can resume once we have been given the okay that we can do so.

Unfortunately, some of our summer programs have had to be adjusted. Our Day in the Park, normally scheduled for the end of June, will possibly be moved into the autumn as an Oktoberfest. Our Independence Day Parade and Fireworks will be cancelled this year, though we would like to have a smaller, neighborhood parade near Labor Day to celebrate our medical staff and first responders. You will hear more about this soon.

If you have not already, please subscribe to our weekly email bulletin program; drop us a note at epinf@hotmail.com if you would like to subscribe. We also have a Facebook page, "Village of Evergreen Park". This will keep you "in the know".

Again, friends, please keep safe. Together, we will all get through this, as there is no better community of neighbors than Evergreen Park.
